PROCEDURE FOR SECOND OPINION ON IMAGING.

My expertise is diagnostic imaging, with experience in all modalities and most diseases diagnosed by imaging . I also spent many years in clinical medicine. My CV is at resume.pdf

I prefer communication by email. manomed@live.com Phoning/texting not desired.

In one paragraph, summarize why you want a second opinion. For instance, was the study misread or not agree with your symptoms? Provide legal name and date of birth.

I will inform you if I cannot assist with your request up front. Otherwise, Paypal $200 donation to info@givethemsanctuary.org in appreciation of my time. See qr-code at end. This will cover one exam and opinion via email. Prepayment is necessary to preclude the high percentage of non-payment.

Formal opinions, additional questions, and additional studies involve additional time and require additional donation (TBD), typically $100 per study or formal report. This represents a discount from my usual fee of $650/hr because I enjoy the work.

By engaging in this consultation agreement Client understands that this is not a patient-doctor or client-lawyer relationship. Nevertheless, Allard agrees that all communication shall remain confidential unless required by law to be revealed. Allard is a licensed physician but not a licensed attorney.

Getting studies to me:

I've found the best method is for you to upload DICOM images to google drive in a zipped file and share that with me. Other cloud methods may suffice. As a last resort, mail a CD.

Based on requests to date, my expertise is imaging of the craniocervical junction for diagnosis of entities such as Eagle Syndrome, Jugular Vein Obstruction, Chiari variants, and spinal disorders. To evaluate vascular conditions a CTA/CTV of head and neck is most helpful.

I am a general radiologist, familiar with all imaging modalities. My special interest is in musculoskeletal and spinal conditions. I am able to review medical records and imaging and opine as to whether malpractice has occurred. Remember, misdiagnosis is not malpractice unless you suffer damages (not just emotional distress).

I am willing to evaluate other complex conditions and will readily admit ignorance, if I cannot help. The intended purpose of consultation is to assist you in:

1. Understanding your imaging studies.
2. How findings on imaging might relate to symptoms.
3. To identify findings that may have been overlooked.
4. To opine on findings that have been reported with which I disagree or which are not critical or important in diagnosing your condition.

As patients with complex problems, you may be presented with many options or no options, and a second opinion must be taken into context. In the end, you, the patient, must decide on a course of action. Education is first step toward healing.

Sincerely, Jeff Allard
